FCI Calculator for the High-Gradient Headwater Streams in Appalachia

To ensure accurate calculations, the <u>UPPERMOST STRATUM</u> of the plant community is determined based on the calculated value for V_{CCANOPY} (≥20% cover is required for tree/sapling strata). Go to the SAR Data Entry tab and enter site characteristics and data in the yellow cells. For information on determining how to split a project into SARs, see Chapter 5 of the Operational Draft Regional Guidebook for the Functional Assessment of High-Gradient Headwater Streams and Low-Gradient Perennial Streams in Appalachia (Environmental Laboratory U.S. Army Corps of Engineers 2017).

 Project Name: Mountain Valley Pipeline

 Location: Franklin County

 Sampling Date: 8/24/21

 Project Site

 Before Project

 Subclass for this SAR:

 Ephemeral Stream

 Uppermost stratum present at this SAR:

 SAR number:

Shrub/Herb Strata

Functional Results Summary:

Enter Results in Section A of the Mitigation Sufficiency Calculator

| Function | Functional Capacity Index |
|------------------------|------------------------------|
| Hydrology | 0.51 |
| Biogeochemical Cycling | 0.31 |
| Habitat | 0.08 |

Variable Measure and Subindex Summary:

| Variable | Name | Average Measure | Subindex |
|------------------------|-------------------------------------------------------|--------------------|----------|
| VCCANOPY | Percent canpoy over channel. | Not Used, <20% | Not Used |
| V _{EMBED} | Average embeddedness of channel. | 1.42 | 0.25 |
| V _{SUBSTRATE} | Median stream channel substrate particle size. | 0.08 | 0.04 |
| V _{BERO} | Total percent of eroded stream channel bank. | 0.00 | 1.00 |
| V _{LWD} | Number of down woody stems per 100 feet of stream. | 0.00 | 0.00 |
| V _{TDBH} | Average dbh of trees. | Not Used | Not Used |
| V _{SNAG} | Number of snags per 100 feet of stream. | 0.00 | 0.10 |
| V _{SSD} | Number of saplings and shrubs per 100 feet of stream. | 94.94 | 1.00 |
| V _{SRICH} | Riparian vegetation species richness. | 0.00 | 0.00 |
| | Average percent cover of leaves, sticks, etc. | 0.00 | 0.00 |
| V _{HERB} | Average percent cover of herbaceous vegetation. | 100.00 | 1.00 |
| V _{WLUSE} | Weighted Average of Runoff Score for Catchment. | 1.00 | 1.00 |

HABITAT ASSESSMENT FIELD DATA SHEET—HIGH GRADIENT STREAMS (BACK)

| | Habitat | | Conditio | n Category | |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | Habitat Parameter | Optimal | Suboptimal | Marginal | Poor |
| | 6. Channel Alteration | Channelization or dredging absent or minimal; stream with normal pattern. | Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present. | Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted. | Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely. |
| | _{score} 18 | 20 19 18 17 16 | 15 14 13 12 11 | 10 9 8 7 6 | 5 4 3 2 1 0 |
| ling reach | 7. Frequency of Riffles (or bends) | Occurrence of riffles relatively frequent; ratio of distance between riffles divided by width of the stream <7:1 (generally 5 to 7); variety of habitat is key. In streams where riffles are continuous, placement of boulders or other large, natural obstruction is important. | Occurrence of riffles infrequent; distance between riffles divided by the width of the stream is between 7 to 15. | Occasional riffle or bend; bottom contours provide some habitat; distance between riffles divided by the width of the stream is between 15 to 25. | Generally all flat water or shallow riffles; poor habitat; distance between riffles divided by the width of the stream is a ratio of >25. |
| samp | score 0 | 20 19 18 17 16 | 15 14 13 12 11 | 10 9 8 7 6 | 5 4 3 2 1 0 |
| Parameters to be evaluated broader than sampling reach | 8. Bank Stability (score each bank) Note: determine left or right side by facing dewastreem. | Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected. | Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion. | Moderately unstable; 30- 60% of bank in reach has areas of erosion; high erosion potential during floods. | Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars. |
| e eva | SCORE 10 | Left Bank 10 9 | 8 7 6 | 5 4 3 | 2 1 0 |
| to b | SCORE 10 | Right Bank 10 9 | 8 7 6 | 5 4 3 | 2 1 0 |
| Parameter | 9. Vegetative Protection (score each bank) | More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally. | 70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well- represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining. | 50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one- half of the potential plant stubble height remaining. | Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height. |
| | SCORE 8 | Left Bank 10 9 | 8 7 6 | 5 4 3 | 2 1 0 |
| | SCORE 8 | Right Bank 10 9 | 8 7 6 | 5 4 3 | 2 1 0 |
| | 10. Riparian Vegetative Zone Width (score each bank riparian zone) | Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone. | Width of riparian zone 12-18 meters; human activities have impacted zone only minimally. | Width of riparian zone 6- 12 meters; human activities have impacted zone a great deal. | Width of riparian zone <6 meters: little or no riparian vegetation due to human activities. |
| | SCORE 8 | Left Bank 10 9 | 8 7 6 | 5 4 3 | 2 1 0 |
| | SCORE 8 | Right Bank 10 9 | 8 7 6 | 5 4 3 | 2 1 0 |

INSERT PHOTOS:

Downstream view within the ROW. Assessment is limited to areas within the temporary ROW.

PROVIDED UNDER SEPARATE COVER

1. This map has been oriented to NAD 1983 UTM ZONE 17N, and vertically to The North American Vertical Datum of 1988 (NAVD 88), using a Real Time Network (RTN) GPS. Field locations were completed on April 15, 2019.

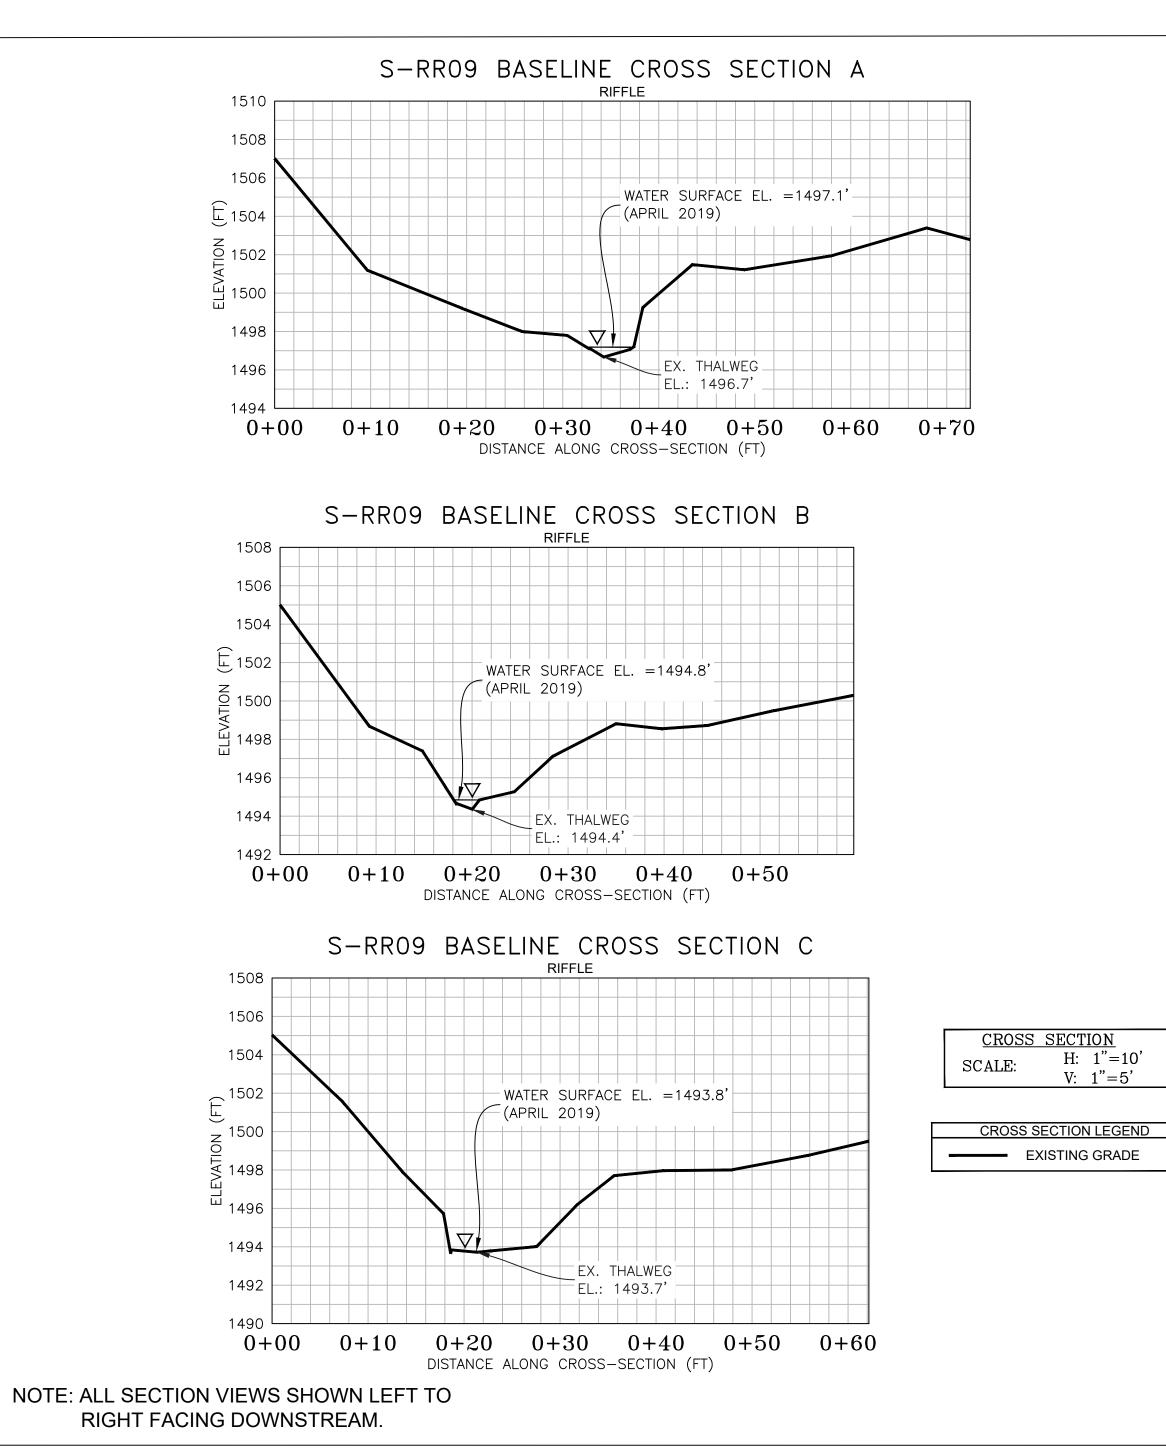

2. Monumentation, including traverse stations and fly points, shown on this drawing should be used to orient any future boundary, topographic, or location survey.

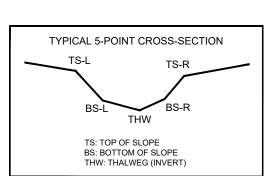

3. Easement lines shown on plan view were provided by Mountain Valley Pipeline (MVP).

4. WSSI Contour Interval = 2.0'. Contours within the channel were interpolated using stream channel breaklines (i.e. top of slopes, toe of slopes, thalweg) and cross-sectional points. Contours outside the channel were interpolated using cross-sectional spot shots.

5. All section views shown are left to right facing downstream.

6. Cross section B shot at location of pipe centerline (based on field stakes).
