## High-Gradient Headwater Streams in Appalachia Field Data Sheet and Calculator

Team: <b>RC, RH</b>	Latitude/UTM Northing: <b>36.987719</b>
Project Name: <b>Mountain Valley Pipeline</b>	Longitude/UTM Easting: <b>-79.698901</b>
Location: <b>Franklin County; Spread I</b>	Sampling Date: <b>9/3/21</b>
SAR Number: <b>S-A19/H26</b>	Reach Length (ft): <b>192</b>
Stream Type: <b>Intermittent Stream</b>	
Top Strata: <b>Tree/Sapling Strata</b> (determined from percent calculated in $V_{CCANOPY}$ )	
Site and Timing: <b>Project Site</b>	<b>Before Project</b>

### Sample Variables 1-4 in stream channel

<b>1</b>	$V_{CCANOPY}$	Average percent cover over channel by tree and sapling canopy. Measure at no fewer than 10 roughly equidistant points along the stream. Measure only if tree/sapling cover is at least 20%. (If less than 20%, enter at least one value between 0 and 19 to trigger Top Strata choice.)  List the percent cover measurements at each point below:	<b>35.5 %</b>																																																		
<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr> <td>0</td><td>0</td><td>90</td><td>90</td><td>90</td><td>90</td><td>20</td><td>90</td><td>80</td><td>0</td> </tr> <tr> <td>0</td><td>20</td><td>40</td><td>30</td><td>0</td><td>40</td><td>30</td><td>0</td><td>0</td><td>0</td> </tr> </table>				0	0	90	90	90	90	20	90	80	0	0	20	40	30	0	40	30	0	0	0																														
0	0	90	90	90	90	20	90	80	0																																												
0	20	40	30	0	40	30	0	0	0																																												
<b>2</b>	$V_{EMBED}$	Average embeddedness of the stream channel. Measure at no fewer than 30 roughly equidistant points along the stream. Select a particle from the bed. Before moving it, determine the percentage of the surface and area surrounding the particle that is covered by fine sediment, and enter the rating according to the following table. If the bed is an artificial surface, or composed of fine sediments, use a rating score of 1. If the bed is composed of bedrock, use a rating score of 5.  Embeddedness rating for gravel, cobble and boulder particles (rescaled from Platts, Megahan, and Minshall 1983 )	<b>2.3</b>																																																		
<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <thead> <tr> <th>Rating</th><th>Rating Description</th></tr> </thead> <tbody> <tr> <td>5</td><td>&lt;5 percent of surface covered, surrounded, or buried by fine sediment (or bedrock)</td></tr> <tr> <td>4</td><td>5 to 25 percent of surface covered, surrounded, or buried by fine sediment</td></tr> <tr> <td>3</td><td>26 to 50 percent of surface covered, surrounded, or buried by fine sediment</td></tr> <tr> <td>2</td><td>51 to 75 percent of surface covered, surrounded, or buried by fine sediment</td></tr> <tr> <td>1</td><td>&gt;75 percent of surface covered, surrounded, or buried by fine sediment (or artificial)</td></tr> </tbody> </table>				Rating	Rating Description	5	<5 percent of surface covered, surrounded, or buried by fine sediment (or bedrock)	4	5 to 25 percent of surface covered, surrounded, or buried by fine sediment	3	26 to 50 percent of surface covered, surrounded, or buried by fine sediment	2	51 to 75 percent of surface covered, surrounded, or buried by fine sediment	1	>75 percent of surface covered, surrounded, or buried by fine sediment (or artificial)																																						
Rating	Rating Description																																																				
5	<5 percent of surface covered, surrounded, or buried by fine sediment (or bedrock)																																																				
4	5 to 25 percent of surface covered, surrounded, or buried by fine sediment																																																				
3	26 to 50 percent of surface covered, surrounded, or buried by fine sediment																																																				
2	51 to 75 percent of surface covered, surrounded, or buried by fine sediment																																																				
1	>75 percent of surface covered, surrounded, or buried by fine sediment (or artificial)

## FCI Calculator for the High-Gradient Headwater Streams in Appalachia

To ensure accurate calculations, the **UPPERMOST STRATUM** of the plant community is determined based on the calculated value for  $V_{CCANOPY}$  ( $\geq 20\%$  cover is required for tree/sapling strata). Go to the SAR Data Entry tab and enter site characteristics and data in the yellow cells. For information on determining how to split a project into SARs, see Chapter 5 of the Operational Draft Regional Guidebook for the Functional Assessment of High-Gradient Headwater Streams and Low-Gradient Perennial Streams in Appalachia (Environmental Laboratory U.S. Army Corps of Engineers 2017).

**Project Name:** Mountain Valley Pipeline

**Location:** Franklin County; Spread I

**Sampling Date:** 9/3/21

Project Site

Before Project

**Subclass for this SAR:**

Intermittent Stream

**Uppermost stratum present at this SAR:**

Tree/Sapling Strata

**SAR number:** S-A19/H26

### Functional Results Summary:

Enter Results in Section A of the Mitigation Sufficiency Calculator

Function	Functional Capacity Index
Hydrology	0.49
Biogeochemical Cycling	0.51
Habitat	0.31

### Variable Measure and Subindex Summary:

Variable	Name	Average Measure	Subindex
$V_{CCANOPY}$	Percent canopy over channel.	35.50	0.31
$V_{EMBED}$	Average embeddedness of channel.	2.26	0.55
$V_{SUBSTRATE}$	Median stream channel substrate particle size.	0.49	0.25
$V_{BERO}$	Total percent of eroded stream channel bank.	57.29	0.77
$V_{LWD}$	Number of down woody stems per 100 feet of stream.	0.00	0.00
$V_{TDBH}$	Average dbh of trees.	0.00	0.00
$V_{SNAG}$	Number of snags per 100 feet of stream.	0.52	0.88
$V_{SSD}$	Number of saplings and shrubs per 100 feet of stream.	Not Used	Not Used
$V_{SRICH}$	Riparian vegetation species richness.	0.00	0.00
$V_{DETRITUS}$	Average percent cover of leaves, sticks, etc.	18.75	0.23
$V_{HERB}$	Average percent cover of herbaceous vegetation.	Not Used	Not Used
$V_{WLUSE}$	Weighted Average of Runoff Score for Catchment.	0.82	0.86

INVESTIGATORS			
FORM COMPLETED BY		DATE _____ TIME _____ AM PM	REASON FOR SURVEY

Parameters to be evaluated in sampling reach	Habitat Parameter	Condition Category			
		Optimal	Suboptimal	Marginal	Poor
	<b>1. Epifaunal Substrate/ Available Cover</b>	Greater than 70% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are <u>not</u> new fall and <u>not</u> transient).	40-70% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	20-40% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 20% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
	<b>SCORE</b>	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	<b>2. Embeddedness</b>	Gravel, cobble, and boulder particles are 0-25% surrounded by fine sediment. Layering of cobble provides diversity of niche space.	Gravel, cobble, and boulder particles are 25-50% surrounded by fine sediment.	Gravel, cobble, and boulder particles are 50-75% surrounded by fine sediment.	Gravel, cobble, and boulder particles are more than 75% surrounded by fine sediment.
	<b>SCORE</b>	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	<b>3. Velocity/Depth Regime</b>	All four velocity/depth regimes present (slow-deep, slow-shallow, fast-deep, fast-shallow). (Slow is < 0.3 m/s, deep is > 0.5 m.)	Only 3 of the 4 regimes present (if fast-shallow is missing, score lower than if missing other regimes).	Only 2 of the 4 habitat regimes present (if fast-shallow or slow-shallow are missing, score low).	Dominated by 1 velocity/depth regime (usually slow-deep).
	<b>SCORE</b>	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	<b>4. Sediment Deposition</b>	Little or no enlargement of islands or point bars and less than 5% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 5-30% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 30-50% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 50% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
	<b>SCORE</b>	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	<b>5. Channel Flow Status</b>	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
	<b>SCORE</b>	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0

# HABITAT ASSESSMENT FIELD DATA SHEET—HIGH GRADIENT STREAMS (BACK)

Habitat Parameter	Condition Category																				
	Optimal					Suboptimal					Marginal					Poor					
<b>6. Channel Alteration</b>	Channelization or dredging absent or minimal; stream with normal pattern.					Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.					Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.					Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.					
<b>SCORE</b>	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>7. Frequency of Riffles (or bends)</b>	Occurrence of riffles relatively frequent; ratio of distance between riffles divided by width of the stream <7:1 (generally 5 to 7); variety of habitat is key. In streams where riffles are continuous, placement of boulders or other large, natural obstruction is important.					Occurrence of riffles infrequent; distance between riffles divided by the width of the stream is between 7 to 15.					Occasional riffle or bend; bottom contours provide some habitat; distance between riffles divided by the width of the stream is between 15 to 25.					Generally all flat water or shallow riffles; poor habitat; distance between riffles divided by the width of the stream is a ratio of >25.					
<b>SCORE</b>	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>8. Bank Stability (score each bank)</b>	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.					Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.					Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.					Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.					
Note: determine left or right side by facing downstream.

# Stream Assessment Form (Form 1)

Unified Stream Methodology for use in Virginia

For use in Wadeable channels classified as intermittent or perennial

Project #	Project Name (Applicant)	Locality	Cowardin Class.	HUC	Date	SAR #	Impact Length	Impact Factor
22865.06	Mountain Valley Pipeline (Mountain Valley Pipeline, LLC)	Franklin County	R4	03010101	9/3/2021	S-A19/H26	212	1
Name(s) of Evaluator(s)		Stream Name and Information					SAR Length	
RC, RH		S-A19/H26					212	
<b>1. Channel Condition:</b> Assess the cross-section of the stream and prevailing condition (erosion, aggradation)								
Conditional Category								
Channel Condition	Optimal	Suboptimal	Marginal	Poor	Severe			
	 Very little incision or active erosion; 80-100% stable banks. Vegetative surface protection or natural rock, prominent (80-100%). AND/OR Stable bankfull benches are present. Access to their original floodplain or fully developed wide bankfull benches. channel bars and transverse bars few. Transient sediment deposition covers less than 10% of bottom.	 Slightly incised, few areas of active erosion or unprotected banks. Majority of banks are stable (60-80%). Vegetative protection or natural rock prominent (60-80%) AND/OR Depositional features contribute to stability. The bankfull and low flow channels are well defined. Stream likely has access to bankfull benches, or newly developed portions of the reach. Transient sediment covers 10-40% of the stream bottom.	 Often incised, but less than Severe or Poor. Banks more stable than Severe or Poor due to lower bank slopes. Erosion may be present on 40-60% of both banks. Vegetative protection on 40-60% of banks. Streambanks may be vertical or undercut. AND/OR 40-60% Sediment may be temporary / transient, contribute instability. Deposition that contribute to stability, may be forming/present. AND/OR V-shaped channels have vegetative protection on > 40% of the banks and depositional features which contribute to stability.	 Overwidened/incised. Vertically / laterally unstable. Likely to widen further. Majority of both banks are near vertical. Erosion present on 60-banks. Vegetative protection present on 20-40% of banks, and is insufficient to prevent erosion. the stream is covered by sediment. Sediment is temporary / transient in nature, and contributing to instability. AND/OR V-shaped channels have vegetative protection is present on > 40% of the banks and stable sediment deposition is absent.	 Deeply incised (or excavated), vertical/lateral instability. Severe incision, flow contained within the banks. Streambed below average majority of banks vertical/undercut. Vegetative protection present on less than 20% of banks, is not preventing erosion. Obvious bank sloughing present. Erosion/raw banks on 80-100%. AND/OR Aggrading channel. than 80% of stream bed is covered by deposition, contributing to instability. Multiple thread channels and/or subterranean flow.			
Scores	3	2.4	2	1.6	1	CI		
NOTES>>	Assessment is limited to areas within the temporary ROW							
<b>2. RIPARIAN BUFFERS:</b> Assess both bank's 100 foot riparian areas along the entire SAR. (rough measurements of length & width may be acceptable)								
Conditional Category								
Riparian Buffers	Optimal	Suboptimal	Marginal	Poor	NOTES>>			
	Tree stratum (dbh > 3 inches) present, with > 60% tree canopy cover. Wetlands located within the riparian areas.	High Suboptimal: Riparian areas with tree stratum (dbh > 3 inches) present, with 30% to 60% tree canopy cover and containing both herbaceous and shrub layers or a non-maintained understory.  Low Suboptimal: Riparian areas with tree stratum (dbh > 3 inches) present, with 30% to 60% tree canopy cover and a maintained understory. Recent cutover (dense vegetation).	High Marginal: Non-maintained, dense herbaceous vegetation with either a shrub layer or a tree layer (dbh > 3 inches) present, with <30% tree canopy cover.  Low Marginal: Non-maintained, dense herbaceous vegetation, riparian areas lacking shrub and tree stratum, hay production, ponds, open water. If present, tree stratum (dbh > 3 inches) present, with <30% tree canopy cover with maintained understory.	High Poor: Lawns, mowed, and maintained areas, nurseries; no-till cropland; actively grazed pasture, sparsely vegetated non-maintained area, recently seeded and stabilized, or other comparable condition.  Low Poor: Impervious surfaces, mine spoil lands, denuded surfaces, row crops, active feed lots, trails, or other comparable conditions.				
Scores	1.5	High 1.2 Low 1.1	High 0.85 Low 0.75	High 0.6 Low 0.5				
1. Delineate riparian areas along each stream bank into Condition Categories and Condition Scores using the descriptors. 2. Determine square footage for each by measuring or estimating length and width. Calculators are provided for you below. 3. Enter the % Riparian Area and Score for each riparian category in the blocks below.					Ensure the sums of % Riparian Blocks equal 100			
Right Bank	% Riparian Area>	10%	20%	20%	40%	90%		
	Score >	0.5	0.6	0.75	0.85			
Left Bank	% Riparian Area>	10%	20%	30%	30%	90%		
	Score >	0.5	0.6	0.75	0.85			
3. INSTREAM HABITAT: Varied substrate sizes, water velocity and depths; woody and leafy debris; stable substrate; low embeddedness; shade; undercut banks; root mats; SAV; riffle/pool complexes, stable features.					Assessment is limited to areas within the temporary ROW.			
Conditional Category								
Instream Habitat/ Available Cover	Optimal	Suboptimal	Marginal	Poor	NOTES>>			
	Habitat elements are typically present in greater than 50% of the reach.	Stable habitat elements are typically present in 30-50% of the reach and are adequate for maintenance of populations.	Stable habitat elements are typically present in 10-30% of the reach and are adequate for maintenance of populations.	Habitat elements listed above are lacking or are unstable. Habitat elements are typically present in less than 10% of the reach.				
Scores	1.5	1.2	0.9	0.5	Stream Gradient High / Low CI 0.50			

## Stream Impact Assessment Form Page 2

Project #	Project Name (Applicant)	Locality	Cowardin Class.	HUC	Date	SAR #	Impact length	Impact Factor

**4. CHANNEL ALTERATION:** Stream crossings, riprap, concrete, gabions, or concrete blocks, straightening of channel, channelization, embankments, spoil piles, constrictions, livestock

Channel Alteration	Conditional Category						NOTES>>	CI
	Negligible	Minor		Moderate	Severe			
	Channelization, dredging, alteration, or hardening absent. Stream has an unaltered pattern or has naturalized.	Less than 20% of the stream reach is disrupted by any of the channel alterations listed in the parameter guidelines.	20-40% of the stream reach is disrupted by any of the channel alterations listed in the parameter guidelines.	40 - 60% of reach is disrupted by any of the channel alterations listed in the parameter guidelines. If stream has been channelized, normal stable stream meander pattern has not recovered.	60 - 80% of reach is disrupted by any of the channel alterations listed in the parameter guidelines. If stream has been channelized, normal stable stream meander pattern has not recovered.	Greater than 80% of reach is disrupted by any of the channel alterations listed in the parameter guidelines AND/OR 80% of banks shored with gabion, riprap, or cement.		
Scores	1.5	1.3	1.1	0.9	0.7	0.5	1.10	
REACH CONDITION INDEX and STREAM CONDITION UNITS FOR THIS REACH								

### REACH CONDITION INDEX and STREAM CONDITION UNITS FOR THIS REACH

NOTE: The CIs and RCI should be rounded to 2 decimal places. The CR should be rounded to a whole number.

**THE REACH CONDITION INDEX (RCI) >> 0.77**

RCI= (Sum of all CIs)/5, except if stream is ephemeral RCI = (Riparian CI/2)

**COMPENSATION REQUIREMENT (CR) >> 163**

CR = RCI X L<sub>i</sub> X IF
