Ver. 10-20-17

FCI Calculator for the High-Gradient Headwater Streams in Appalachia

To ensure accurate calculations, the <u>UPPERMOST STRATUM</u> of the plant community is determined based on the calculated value for V_{CCANOPY} (≥20% cover is required for tree/sapling strata). Go to the SAR Data Entry tab and enter site characteristics and data in the yellow cells. For information on determining how to split a project into SARs, see Chapter 5 of the Operational Draft Regional Guidebook for the Functional Assessment of High-Gradient Headwater Streams and Low-Gradient Perennial Streams in Appalachia (Environmental Laboratory U.S. Army Corps of Engineers 2017).

Project Name: Mountain Valley Pipeline

Location: S-CC13 **Sampling Date:** 9/2/21

Project Site Before Project

Subclass for this SAR:

Intermittent Stream

Uppermost stratum present at this SAR: SAR number: S-CC13

Shrub/Herb Strata

Functional Results Summary:

Enter Results in Section A of the Mitigation Sufficiency Calculator

Function	Functional Capacity Index
Hydrology	0.23
Biogeochemical Cycling	0.15
Habitat	0.11

Variable Measure and Subindex Summary:

Variable	Name	Average Measure	Subindex
V _{CCANOPY}	Percent canpoy over channel.	Not Used, <20%	Not Used
V _{EMBED}	Average embeddedness of channel.	1.00	0.10
V _{SUBSTRATE}	Median stream channel substrate particle size.	0.08	0.04
V _{BERO}	Total percent of eroded stream channel bank.	0.00	1.00
V_{LWD}	Number of down woody stems per 100 feet of stream.	0.00	0.00
V _{TDBH}	Average dbh of trees.	Not Used	Not Used
V_{SNAG}	Number of snags per 100 feet of stream.	0.00	0.10
V _{SSD}	Number of saplings and shrubs per 100 feet of stream.	115.38	1.00
V _{SRICH}	Riparian vegetation species richness.	0.00	0.00
V _{DETRITUS}	Average percent cover of leaves, sticks, etc.	92.50	1.00
V _{HERB}	Average percent cover of herbaceous vegetation.	6.75	0.09
V _{WLUSE}	Weighted Average of Runoff Score for Catchment.	0.41	0.43

INVESTIGATORS		
FORM COMPLETED BY	DATE AM PM	REASON FOR SURVEY

	Habitat		Condition	ı Category		
	Parameter	Optimal	Suboptimal	Marginal	Poor	
	1. Epifaunal Substrate/ Available Cover	Greater than 70% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are not new fall and not transient).	40-70% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	20-40% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 20% stable habitat; lack of habitat is obvious; substrate unstable or lacking.	
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0	
n sampling reach	2. Embeddedness	Gravel, cobble, and boulder particles are 0-25% surrounded by fine sediment. Layering of cobble provides diversity of niche space.	Gravel, cobble, and boulder particles are 25- 50% surrounded by fine sediment.	Gravel, cobble, and boulder particles are 50- 75% surrounded by fine sediment.	Gravel, cobble, and boulder particles are more than 75% surrounded by fine sediment.	
ted in	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0	
Parameters to be evaluated in sampling reach	3. Velocity/Depth Regime	All four velocity/depth regimes present (slow-deep, slow-shallow, fast-deep, fast-shallow). (Slow is < 0.3 m/s, deep is > 0.5 m.)	Only 3 of the 4 regimes present (if fast-shallow is missing, score lower than if missing other regimes).	Only 2 of the 4 habitat regimes present (if fast- shallow or slow-shallow are missing, score low).	Dominated by 1 velocity/depth regime (usually slow-deep).	
ıram	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0	
Pa	4. Sediment Deposition	Little or no enlargement of islands or point bars and less than 5% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 5-30% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 30-50% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 50% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.	
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0	
	5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.	
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0	

HABITAT ASSESSMENT FIELD DATA SHEET—HIGH GRADIENT STREAMS (BACK)

	Habitat		Condition Category							
	Parameter	Optimal	Suboptimal	Marginal	Poor					
	6. Channel Alteration	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.					
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0					
oling reach	7. Frequency of Riffles (or bends)	Occurrence of riffles relatively frequent; ratio of distance between riffles divided by width of the stream <7:1 (generally 5 to 7); variety of habitat is key. In streams where riffles are continuous, placement of boulders or other large, natural obstruction is important.	Occurrence of riffles infrequent; distance between riffles divided by the width of the stream is between 7 to 15.	Occasional riffle or bend; bottom contours provide some habitat; distance between riffles divided by the width of the stream is between 15 to 25.	Generally all flat water or shallow riffles; poor habitat; distance between riffles divided by the width of the stream is a ratio of >25.					
samp	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0					
Parameters to be evaluated broader than sampling reach	8. Bank Stability (score each bank) Note: determine left or right side by facing downstream.	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.					
e eva	SCORE (LB)	Left Bank 10 9	8 7 6	5 4 3	2 1 0					
to be	SCORE (RB)	Right Bank 10 9	8 7 6	5 4 3	2 1 0					
Parameters	9. Vegetative Protection (score each bank)	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one- half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.					
	SCORE (LB)	Left Bank 10 9	8 7 6	5 4 3	2 1 0					
	SCORE (RB)	Right Bank 10 9	8 7 6	5 4 3	2 1 0					
	10. Riparian Vegetative Zone Width (score each bank riparian zone)	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6- 12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.					
	SCORE (LB)	Left Bank 10 9	8 7 6	5 4 3	2 1 0					
ĺ	SCORE (RB)	Right Bank 10 9	8 7 6	5 4 3	2 1 0

Stream Assessment Form (Form 1) Unified Stream Methodology for use in Virginia e channels classified as intermittent or perennial Cowardin **Impact** Impact Project # Project Name (Applicant) Locality HUC Date SAR# Class Lenath Factor Mountain Valley Pipeline (Mountain Pittslyvania 22865.06 R4 03010105 9/2/2021 **S-CC13** 20 1 Valley Pipeline, LLC) SAR Length Name(s) of Evaluator(s) Stream Name and Information DW, RH, RC **UNT to Cherrystone Creek** 65 1. Channel Condition: Assess the cross-section of the stream and prevailing condition (erosion, aggradation) Optimal Suboptimal Poor Severe Marginal Slightly incised, few areas of active Often incised, but less than Severe or Very little incision or active erosion; 80 Overwidened/incised. Vertically / Deeply incised (or excavated) 100% stable banks. Vegetative surfact protection or natural rock, prominent sion or unprotected banks. Majority of banks are stable (60-80%). vertical/lateral instability. Severe ision, flow contained within the bank Banks more stable than Severe laterally unstable. Likely to wid Majority of both ban Channel 80-100%). AND/OR Stable point bars Vegetative protection or natural rock Erosion may be present on 40-60% of vertical. Erosion present on 60-80% of Streambed below average rooting depth Condition bankfull benches are present. Access to their original floodplain or fully both banks. Vegetative protection on 40-60% of banks. Streambanks may be prominent (60-80%) AND/OR Depositional features contribute to banks. Vegetative protection present on 20-40% of banks, and is insufficient majority of banks vertical/undercut. Vegetative protection present on less leveloped wide bankfull benches. Mid stability. The bankfull and low flow vertical or undercut. AND/OR to prevent erosion. AND/OR 60-80% o than 20% of banks, is not preventing channel bars and transverse bars few. Transient sediment deposition covers less than 10% of bottom. 40-60% Sediment may be temporary transient, contribute instability. Deposition that contribute to stability, hannels are well defined. Stream like as access to bankfull benches,or new the stream is covered by sediment. Sediment is temporary / transient in erosion. Obvious bank sloughing sent. Erosion/raw banks on 80-100% developed floodplains along nature, and contributing to instability AND/OR Aggrading channel. Greater portions of the reach. Transient liment covers 10-40% of the stream may be forming/present. AND/OR V-shaped channels have vegetative AND/OR V-shaped channels have vegetative protection is present on > than 80% of stream bed is covered by deposition, contributing to instability. bottom protection on > 40% of the banks and 40% of the banks and stable sediment Multiple thread channels and/or depositional features which contribute deposition is absent subterranean flow to stability. CI 2.4 3.00 Scores 3 1.6 NOTES>> 2. RIPARIAN BUFFERS: Assess both bank's 100 foot riparian areas along the entire SAR. (rough measurements of length & width may be acceptable) **Conditional Category** NOTES>> Optimal Suboptimal Marginal Poor Low Marginal: Non-maintained High Poor: Lawns High Suboptima Low Suboptimal High Marginal Low Poor: dense herbaceou maintained areas Riparian areas wit Riparian areas with regetation, ripariar areas lacking shrub Non-maintained nurseries: no-till Impervious ree stratum (dbh tree stratum (dbh : nse herbaceo cropland; actively 3 inches) present 3 inches) present Tree stratum (dbh > 3 inches) present vegetation with and tree stratum grazed pasture, spoil lands. Riparian with 30% to 60% with 30% to 60% hay production, onds, open wate If present, tree either a shrub laye or a tree layer (dbl parsely vegetated non-maintained with > 60% tree canopy cover. nuded surfaces tree canopy cove and containing bot tree canopy cover and a maintained **Buffers** Wetlands located within the riparian row crops, active areas. > 3 inches) area, recently feed lots, trails, o herbaceous and understory. Recer cutover (dense resent, with <30% stratum (dbh >3 seeded and other comparable shrub layers or a inches) present, with <30% tree stabilized, or othe conditions tree canopy cover non-maintained vegetation). comparable understory. canopy cover with maintained condition. understory. REACH CONDITION INDEX and STREAM CONDITION UNITS FOR THIS REACH

NOTE: The CIs and RCI should be rounded to 2 decimal places. The CR should be rounded to a whole number.

THE REACH CONDITION INDEX (RCI) >> 1.07

RCI= (Sum of all Cl's)/5, except if stream is ephemeral RCI = (Riparian Cl/2)

COMPENSATION REQUIREMENT (CR) >>

CR = RCI X L_I X IF

BENCHMARK POINT (WSSI)

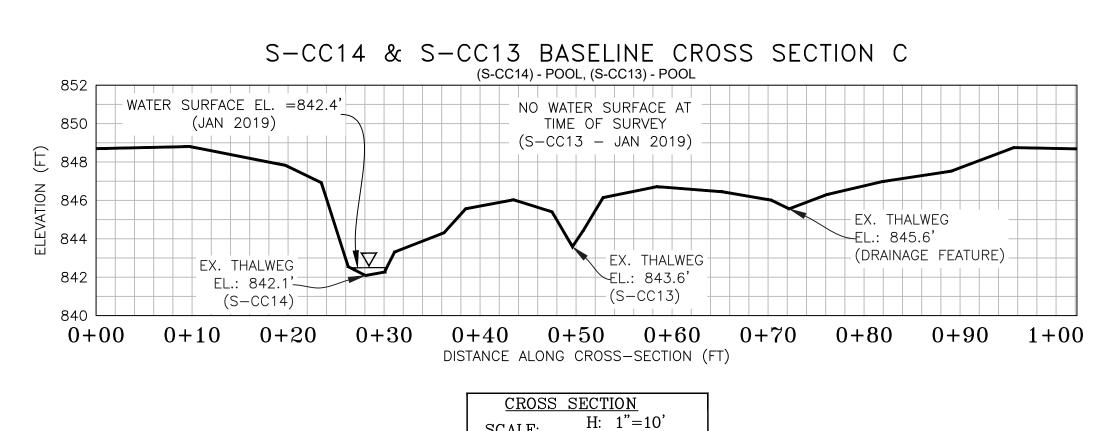

SURVEY NOTES:

- 1. This map has been oriented to NAD 1983 UTM ZONE 17N, and vertically to The North American Vertical Datum of 1988 (NAVD 88), using a Real Time Network (RTN) GPS. Field locations were completed on January 22, 2019.
- 2. Monumentation, including traverse stations and fly points, shown on this drawing should be used to orient any future boundary, topographic, or location survey.
- 3. Easement lines shown on plan view were provided by Mountain Valley Pipeline (MVP).
- 4. WSSI Contour Interval = 2.0'. Contours within the channel were interpolated using stream channel breaklines (i.e. top of slopes, toe of slopes, thalweg) and cross-sectional points. Contours outside the channel were interpolated using cross-sectional spot shots.
- 5. All section views shown are left to right facing downstream.
- 6. Cross-section B shot at location of pipe centerline (based on best professional judgement).
