Resource Post-Crossing Conditions														
1	Were all applicable resource specific crossing conditions satisfied?							N/A						
'	Time o	of Year	Restrictio	ons (	TOYR)? N/A	Mussel	Rel	loca	ition? N	/A_				
2	This qu	This question is not applicable in WV.												
3	Which crossing methods were utilized during the stream crossing? (If so select one or more)  Dam & Pump Flume Cofferdam Conventional Bore Horizontal Directional Drill (HDD) Bore													
4	Was the top 1-foot (12-inches) of streambed substrate segregated and stockpiled separate from trench spoils?							Yes						
5	Was excess material not needed for backfill removed and disposed of in an upland area?							Yes						
6	Was the top 12-inches of backfill made with clean native stream substrate?						Yes							
7	Was the pre-construction survey data utilized during restoration in attempt to re-establish pre-construction contours?						Yes							
8	Were any field modifications to the stream implemented by project or regulatory personnel to address potential drainage or bank restoration limitations?						No							
9	Were impervious trench breakers/plugs properly installed within 25-feet of top-of-bank to prevent subsurface erosion to or from the resource area?						Yes							
10	Was permanent seed and stabilization material (straw or matting) applied to riparian areas and stream banks prior to re-establishing flow to the impact area of the channel?						Yes							
11							Yes							
12	Have civil surveys been scheduled to verify as-built conditions meet pre-construction conditions in accordance with the project Mitigation Framework and federal/state permit requirements?							Yes						
13								N/A						
14	Did any unauthorized discharges to unpermitted resources occur during the crossing? If so, explain the corrective actions implemented in the Comments section and include additional photos.						No

18	Instream Habitat Conditions: Examples: depths, presence of woody/leafy debris, stable su shade protection, undercut banks, root mats, Var vegetation Rating: 1-Optimal (Habitat conditions of resource), 3-Marginal (Habitat condition of resource)	ubstrate with low ied combination present in >50%	amount of mobile particles, low ember of water velocities, submerged aquati of resource), 2-Suboptimal (Habitat c	eddedness, ic onditions in	4	4	
19	Channel Alterations: Examples: Straighte along banks, concrete/gabions/concrete block, r agricultural impacts Rating: 1-Negligible (unalte channel alterations), 3-Moderate (40-80% of	manmade emba ered/natural stre	nkments, constrictions w/in channel, li am), 2-Minor (20-40% of resource dis	ivestock or rupted by	4	4	

## **Additional Notes**

**Pre-Construction Notes** 

Pre-Construction Meeting - 11/9/2023

- 15. Substrate consisted of mud/silt/clay overlain with nonnative gravel.
- 16, 17, 18, 19. No water observed in resource. Poor habitat conditions throughout resource resulting in low scores in all categories.

11/13/2023 - Survey marked OHWM in resource. No work occurred in resource.

- 11/17/2023 First 12 inches of substrate excavated from aquatic resource and stored in designated containment structure (Photo 1). Excavated and hammered in trench through road and aquatic resources (both sides of road) (Photo 2). Timber mat bridge (TMB) placed and removed over trench through aquatic resource and road throughout the day. Flume pipe installed in resource. 11/18/2023 and 11/20/2023 Excavated and hammered in trench through aquatic resources and adjacent riparian buffers. TMB removed and replaced over resource throughout day. Flume removed and replaced at the beginning and end of day, respectively. 11/21/2023 Rain out
- 11/22/2023 Welding ongoing. Trench dewatered in aquatic resource area. Sandbag "pillows" added to trench for padding (Photo 3). Pipe lowered into trench (Photo 4). TMB removed and replaced over resource throughout day. Flume removed and replaced. 11/24/2023 No water in stream resource. Welding and x-ray occurred outside of aquatic resource boundary.
- 11/25/2023 Continued to excavate trench north of aquatic resource. Sandblasted and coated. Placed sandbag "pillows" then pipe in trench north of aquatic resource. Welding and x-ray ongoing. Added gravel to intersection of road and ROW. Cleaned out inlet of flume where gravel had fallen over side covering part of pipe. Sandblasted and coated weld south of aquatic resource. Flume pipe remained in place.
- 11/26/23 Completed repair work outside of aquatic resource area in the section of pipe that will be installed next. Additional sandbags "pillows" then pipe placed in trench north of aquatic resource. Welded, sandblasted, and coated outside resource area. No work being completed near resource crossings. Flume pipe remained in place.
- 11/27/2023 11/28/2023 Welding continued, tied-in to pipe through aquatic resource, jeeped, and rock shielding. Padding soil prepared. Added more grave to road. No work occurred within aquatic resource boundary.
- 11/29/2023 Additional padding soil prepared and added to trench. Welding and coating continued. Constructed concrete trench breakers for road crossing (Photo 5).
- 11/30/2023 Welding and coating ongoing outside of aquatic resource area. Backfilled with padding dirt (Photo 6). Subsoil (Photo 7) and topsoil added in buffer. Flume and timber mat had to be placed as well for safety purposes.
- 12/01/2023 Installed test station in resource buffer zone on northern edge of road. Flume pipe and TMB removed from resource. Contoured topsoil in resource. Survey shot elevations (Photo 8). Environmental crew replaced P1 silt saver fence outside resource area (northern side). Environmental crew applied Curlex and installed secondary P1 fence on southern side of aquatic resource area. Environmental crew applied Curlex uphill above secondary P1 fence. Work ceased due to rain. Backfilling resumed north of aquatic resource, outside buffer zone. Graded riparian buffer.
- 12-02-2023 Worked outside resource padding and backfilling trench. Survey onsite. Survey shot OHWM elevations. Applied curlex above OHWM and installed P1 fencing. Environmental crew called to different location. 12/04/2023 Seed applied to resource.

## Post Construction Notes

Water observed in resource, pooled at downstream edge of ROW.

16., 17. Crossing and riparian areas have been recently restored. These areas will be monitored until 80% vegetative coverage has been achieved and areas that do not have 80% vegetative cover within 30 days will be reseeded.

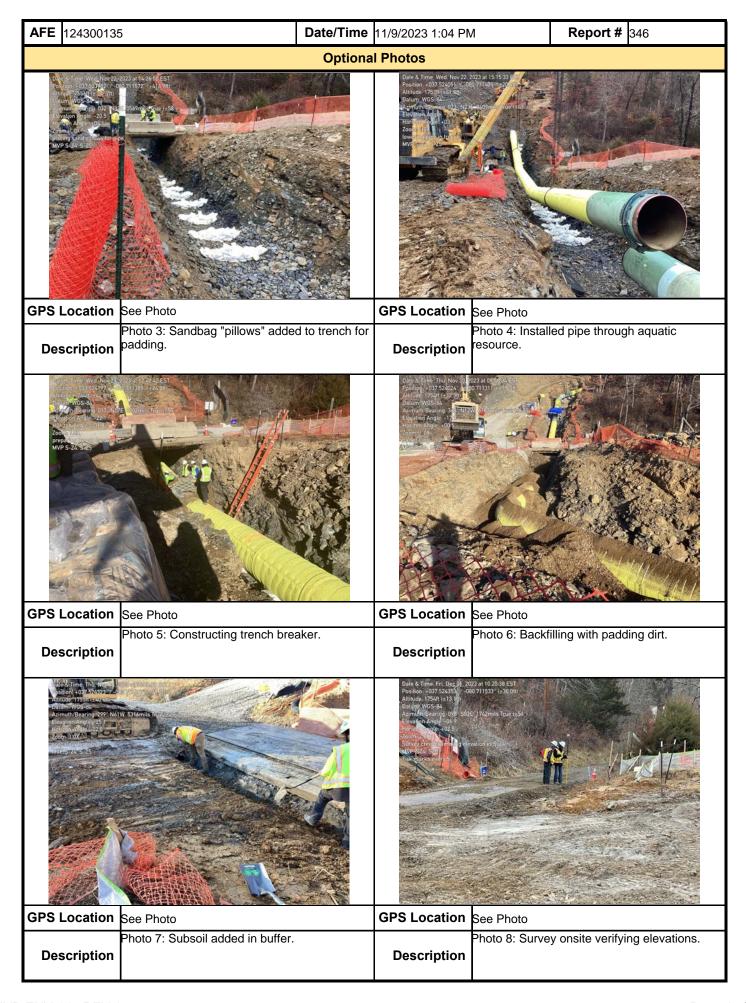

In accordance with the Mountain Valley Pipeline Comprehensive Stream and Wetland Monitoring, Restoration and Mitigation Framework, this independent report was completed to document the on-site monitoring of instream invertebrate and fisheries resources during all construction activity related to waterbody and wetland crossings, and document instream conditions and any impacts to the resources.
