Resource Post-Crossing Conditions													
1	Were	all app	licable res	sour	ce specific crossing o	ondition	s sa	atisfied?					N/A
1	Time o	of Year	Restrictio	ons ((TOYR)? <u>N/A</u> M	ussel Re	loc	ation? N	<u>/A</u>				
2	This qu	This question is not applicable in WV.											
3	Which crossing methods were utilized during the stream crossing? (If so select one or more) Dam & Pump Flume Cofferdam Conventional Bore Horizontal Directional Drill (HDD) Bore												
4	Was the top 1-foot (12-inches) of streambed substrate segregated and stockpiled separate from trench spoils?						Yes						
5	Was excess material not needed for backfill removed and disposed of in an upland area?							N/A					
6	Was the top 12-inches of backfill made with clean native stream substrate?						Yes						
7	Was the pre-construction survey data utilized during restoration in attempt to re-establish pre-construction contours?					Yes							
8	Were any field modifications to the stream implemented by project or regulatory personnel to address potential drainage or bank restoration limitations?					No							
9	Were impervious trench breakers/plugs properly installed within 25-feet of top-of-bank to prevent						See Below						
10	Was permanent seed and stabilization material (straw or matting) applied to riparian areas and stream banks prior to re-establishing flow to the impact area of the channel?						Yes						
11	Was the time of disturbance minimized by conducting resource work continuously to completion?						Yes						
12	Have civil surveys been scheduled to verify as-built conditions meet pre-construction conditions in accordance with the project Mitigation Framework and federal/state permit requirements?						Yes						
13	Are bareroot saplings required and/or scheduled to be planted for the dormant season (10/1 - 4/30)?						N/A						
14	Did any unauthorized discharges to unpermitted resources occur during the crossing? If so, explain the corrective actions implemented in the Comments section and include additional photos.						No						
	Biological Conditions Pre-Con							Post-Con					
15	Predor (<0.1"),			Тур	oe (select one):Bedrock	Boulder (>10'	'), Cobble (2-	-10"), Gra	vel (0.1-2"), Sai	nd ¹	Mud/Silt/Cl ay	Mud/Silt/Cl ay
16	Channel Conditions:Rating: 1-Optimal (80-100% stable banks), 2-Sub-optimal (60-80% stable banks), 3-Marginal (40-60% stable banks), 4-Poor (20-40% stable banks), 5-Severe (0-20% stable banks, highly eroded or unvegetated banks						2						
17	Riparian Buffer Zone within ROW and ≤50 ft. from Stream Top-of-Bank: Rating: 1-Optimal (60-100% heavy vegetative cover), 2-Sub-optimal (30-60% mixed vegetated coverage), 3-Marginal (<30% vegetative coverage), 4-Poor (Mowed/maintained area or farmland, impervious area, sparsely vegetated coverage, etc.)					3

AFE	124300131 Date		12/22/2023 7:04 PM	Report	# 471	471	
	Biological Co	nditions Co	ntinued		Pre-Con	Post-Con	
18	Instream Habitat Conditions: Examples: Varied substrate sizes, varied combination of water velocities & depths, presence of woody/leafy debris, stable substrate with low amount of mobile particles, low embeddedness, shade protection, undercut banks, root mats, Varied combination of water velocities, submerged aquatic vegetation Rating: 1-Optimal (Habitat conditions present in >50% of resource), 2-Suboptimal (Habitat conditions in 30-50% of resource), 3-Marginal (Habitat conditions in 10-30% of resource), 4-Poor (Habitat conditions in 0-10% of resource)					2	
19	Channel Alterations: Examples: Straighte along banks, concrete/gabions/concrete block, r agricultural impacts Rating: 1-Negligible (unalte channel alterations), 3-Moderate (40-80% of	nanmade emba ered/natural stre	nkments, constrictions w/in channel, li am), 2-Minor (20-40% of resource dis	ivestock or rupted by	1	1	

Additional Notes

There was no flow in S-B38 so a dam and temporary flume was used for this crossing. A ditch dewatering system was set up and was used as needed throughout the stream crossing.

Stream S- B38 is in close proximity to multiple other resource crossings. The overlapping buffer areas that intertwine the stream channels and wetland boundaries caused traditional trench breaker placement and the immediate restoration of the buffer zone to be impractical.

Expanded notes for question 9: Bentonite trench breakers were built at 64' from the coming in side (CIS) and at 28' from the going away side (GAS) ordinary high water marks. The onsite civil survey crew verified the trench breaker locations.

Expanded notes for question 17: The disturbed portion of the 50' riparian zones were restored to pre-construction elevations, seeded, and protected with erosion control devices.

12/21/2023: Topsoil from the 10' stream buffer zone was stripped and segregated on plastic sheeting in an upland area. Afterward the stream substrate was placed in super sacks and stored in an upland area. Native stream subsoil was separated so it could be used as backfill material. The ditch excavation was extended enough for another pipe section to be lowered in and welded in place. Backfilling was completed through stream S-B34.

12/22/2023: The major stream crossing (S-B34) that runs adjacent to S-B38 was completely restored and a flume pipe was installed at the end of the day for water conveyance on S-B38 during Christmas Break.

12/23/2023-12/26/2023: Christmas Break.

12/27/2023; Rain out.

12/28/2023: The next section of pipe was welded, while site preparation for ditch excavation for the following day was conducted.

12/29/2023: The next section of the ditch was excavated, which extended through the remaining features in the area to be crossed.

12/30/2023: The dam and pump around was reinstalled and the flume pipe was removed. With ditching completed, the next section of pipe was lowered in and welded in place.

12/31/2023: The trench was backfilled from CIS of S-B35 through to the GAS of S-B39B. The subsoil was brought back to pre-construction elevation in preparation to restore multiple resources after the New Year holiday break.

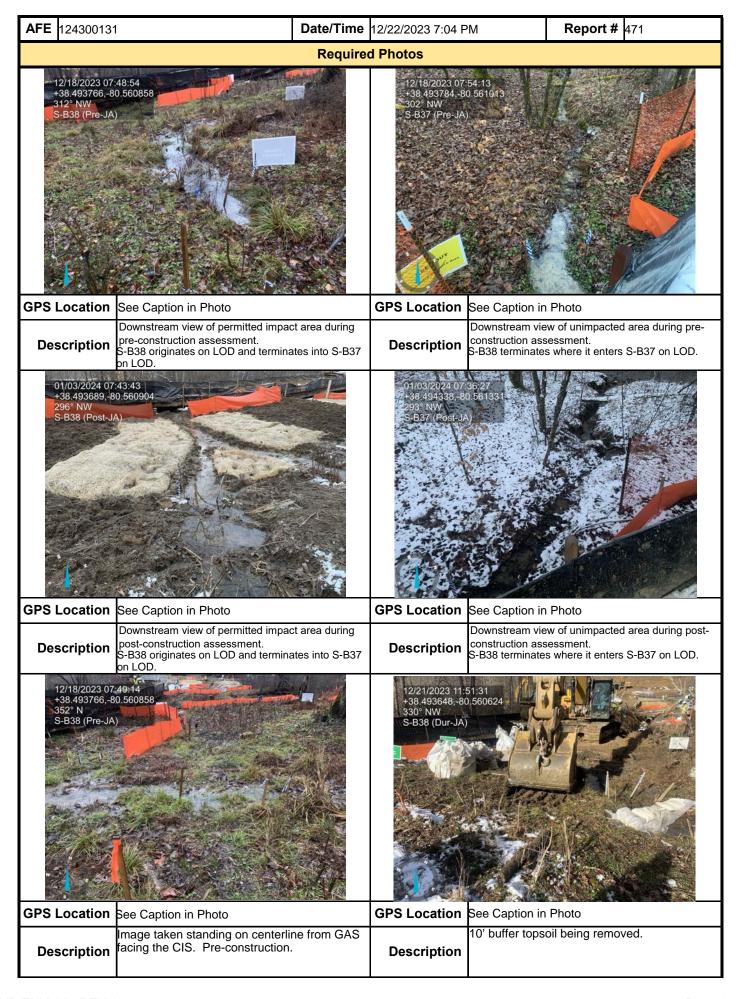

1/1/2024: Holiday break.

1/2/2024: The stream substrate was replaced and brought back to pre-construction elevation. The stream banks were reconstructed through the 10' buffer, and all contours, elevations, and other significant points were verified by civil survey. The stream banks were properly seeded prior to installing erosion control blankets, straw mulch, and silt fence. The dam and pump around conveyance system was removed and natural flow was re-established.

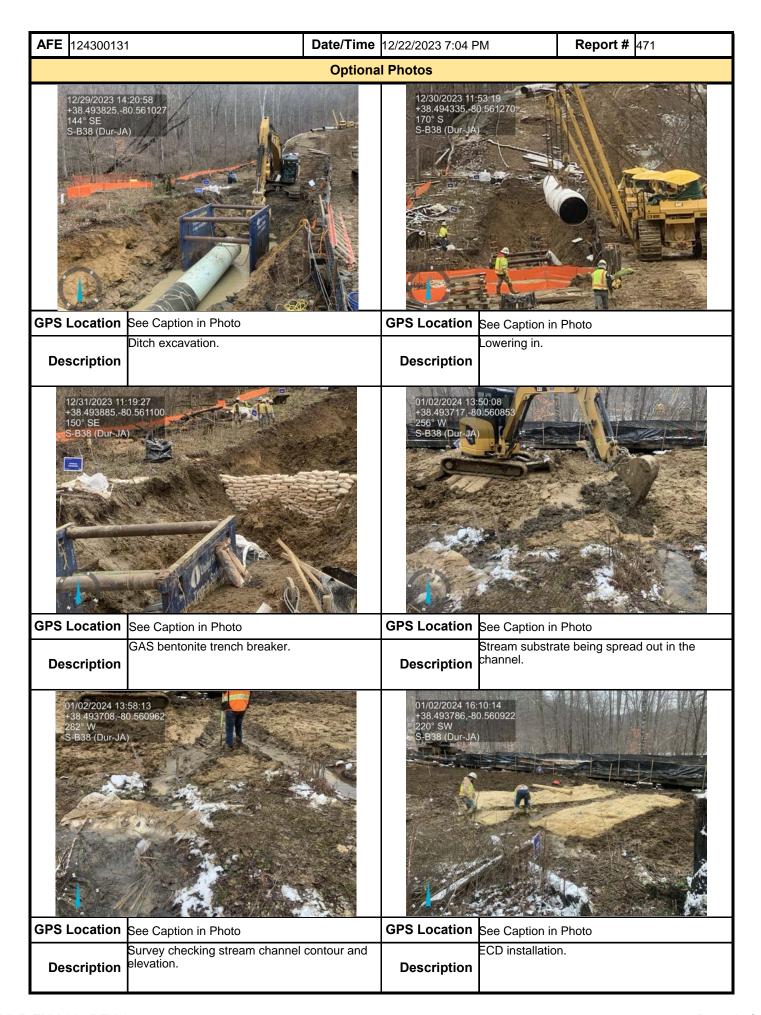

In accordance with the Mountain Valley Pipeline Comprehensive Stream and Wetland Monitoring, Restoration and Mitigation Framework, this independent report was completed to document the on-site monitoring of instream invertebrate and fisheries resources during all construction activity related to waterbody and wetland crossings, and document instream conditions and any impacts to the resources.
